

ICS Cybersecurity Evaluation (401) Training

Network Segmentation Exercise

Create a New Network Segmentation to Better Protect Your Assets.

Time: 30 minutes

Resources: Pen and paper

This does
NOT need to
be submitted
after
completion.

Instructions

Review the network diagram on the next page (See also *Network Segmentation Activity: Introduction* video on the CISA VLP). If you were given this map in an evaluation situation, what ideas come to mind? How would you segment this network? There is no single, correct answer. Feel free to discuss with others in your organization where you're employed to gain additional perspectives.

Using a pen and paper, sketch out a new network diagram with all the assets shown below. You can add new items (e.g., additional firewalls) if you want as long as the design is practical to deploy in a live environment. When you finish, watch the *Network Segmentation Activity: Debrief* video on the CISA VLP.

Consider the following questions:

- Does the design implement any segmentation?
- Do you see any critical data paths?
- Are some devices arguably in the wrong network?
- If a particular host was compromised, are there sensitive devices nearby in the same network segment?
- What are the top concerns that stand out to you?
- If you were to segment this network further, what would you create? Sketch out a new network using paper and pen. Remember, there is no perfect answer. Simply trying is a great way to start. The instructor will review ideas upon completion of this activity.

Consider:

Rather than designing a perfect ICS network, simply try to consider a model that may offer potential for more access control, efficiency, and growth. You are learning to evaluate a situation. Reviewing bad ideas is a great way to notice them.
